

INDIVIDUAL PROJECT PROGRESS REPORT

Setshabelo Integrated Website & Mobile Application
Secret Design Group – Setshabelo Primary School

Student Name	Andries Mohau Matona
Project	Setshabelo Integrated Website & Mobile Application
Stakeholder	Setshabelo Primary School, Thabong, Welkom
Project Group	Secret Design
Document Type	Individual Progress Report
Current Focus	System requirements, use-case analysis and system design

1. Introduction

This document records my individual progress on the Secret Design project for Setshabelo Primary School. The project is focused on developing a digital admission and communication system that allows parents to create accounts, submit learner applications, monitor application status, and receive school updates and achievements. The system also provides administrators with functions for reviewing applications and publishing school information.

2. My Individual Contribution

My current contribution has focused on understanding and developing the system requirements and translating those requirements into system-design artefacts. I worked particularly on the use-case structure for the parent and administrator sides of the system. This helped me understand how each actor interacts with the system and how the different functions are connected.

Area	Progress / Contribution
Requirements understanding	Reviewed the required parent and administrator functions and considered how they fit into the admission
Use-case analysis	Identified the main actors and use cases required for parents and administrators.
Use-case diagram	Worked on the Setshabelo Admission System use-case diagram, including account creation, login, learner
Parent workflow	Considered the flow from parent account creation and login to submitting and tracking learner application
Multiple children	Included the project requirement that one parent account should support applications for different children
Administrator workflow	Included administrator login, reviewing learner applications, accepting/rejecting applications, and publishi
System design	Used the requirements to support the development of the project's broader design documentation.

3. Use-Case Diagram Progress

The use-case diagram below represents the current design work. It shows the Parent and Administrator as the two main actors. The parent side includes account creation, login, updating personal details, submitting a learner application, viewing application status, validating application details, viewing school updates and achievements, and cancelling an application. The administrator side includes administrator login, reviewing learner applications, accepting or rejecting applications, and publishing school updates and achievements.

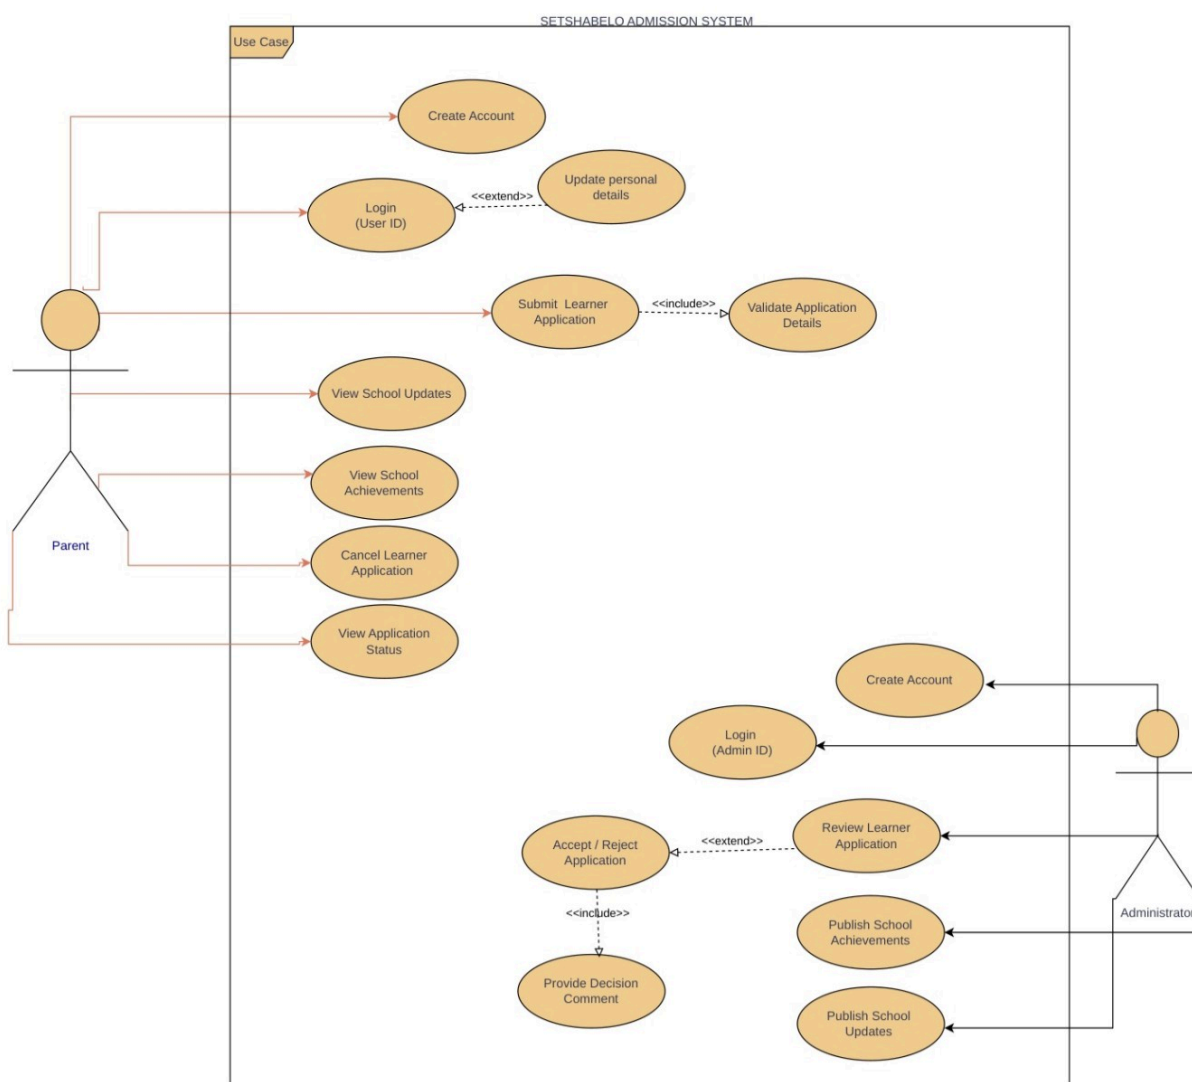

Figure 1: Current Setshabelo Admission System use-case diagram.

4. Progress Achieved

- I have developed a clearer understanding of the purpose and scope of the Setshabelo Integrated Website & Mobile Application.

- I have identified the main system actors and the functions they need to perform.
- I have contributed to the use-case representation of the admission process.
- I have considered the parent account structure, including the ability for one parent to manage applications for different children.
- I have connected the system requirements to practical system-design decisions.
- The current work provides a foundation for the next design and implementation activities.

5. Challenges Encountered

One of the main challenges has been ensuring that the diagram represents the actual system requirements rather than only showing general functions. In particular, the relationship between a parent account and multiple learner applications needs to be represented clearly. Another challenge is deciding where validation takes place and which activities belong to the parent and which belong to the administrator. These issues require continuous checking against the Software Requirements Specification.

6. Next Steps

- Refine the use-case diagram so that all relationships and system responsibilities are clear.
- Finalise the detailed parent workflow, including account creation, username choice, password/PIN creation, login and multiple learner applications.
- Continue with the sequence diagrams and other required system-design artefacts.
- Ensure the database/entity design supports one parent account having multiple learner applications.
- Review the design against the Software Requirements Specification before implementation.
- Continue contributing to testing, documentation and integration activities assigned to the group.

7. Individual Reflection

Through my progress on the project, I have learned that system design requires more than simply listing features. Each requirement must be connected to an actor, a process and a clear system responsibility. Working on the use-case diagram has helped me understand the admission process from both the parent's and administrator's perspectives. I have also learned the importance of checking diagrams against the SRS so that important requirements are not left out. My next focus is to improve the accuracy and detail of the design and to continue contributing to the development of the complete Setshabelo system.

8. Conclusion

My individual progress is currently centred on requirements analysis and system design. The work completed so far has contributed to defining how parents and administrators will interact with the Setshabelo system. I will continue refining the design and supporting the group as the project moves from requirements and design towards implementation and testing.
